The technology company eologix develops and produces innovative, retrofittable sensor solutions for smart surfaces. The energy yield of wind turbines can be increased through the instalment of multiple autonomous, thin and flexible sensors for precise ice detection and temperature measurement on rotor blades. This enables the safe and optimal operation of turbines in areas where there is a risk of icing.

Certified by DNV-GL and patented, the unique eologix sensors are mounted directly to the surface of the rotor blades. They are easily applied during production, construction or retrofit of any turbine, old or new. Further solutions for blade and power train condition monitoring are currently being introduced into the market.

Interest in a cooperation:

Looking for cooperation partners in the field of condition monitoring in industry and harsh environments.
